

500 MHZ Solid State Amplifier Design Results of the 4KW Prototype

M. Gaspar, M. Pedrozzi

4KW Validation Prototype - Components Produced and Tested

PC Master Controller: 2 Available and Already Tested (PSI Design)

Power Supply Controller: 25 Boards Available (Programmed and Tested) (PSI Design)

Power Splitter: 2 8-Way Prototypes Working (PSI Design)

New 18-way Design in Progress (PSI Design)

250W Amplifier Module: 22 Modules Available (Assembled and Tested) (PSI Design)

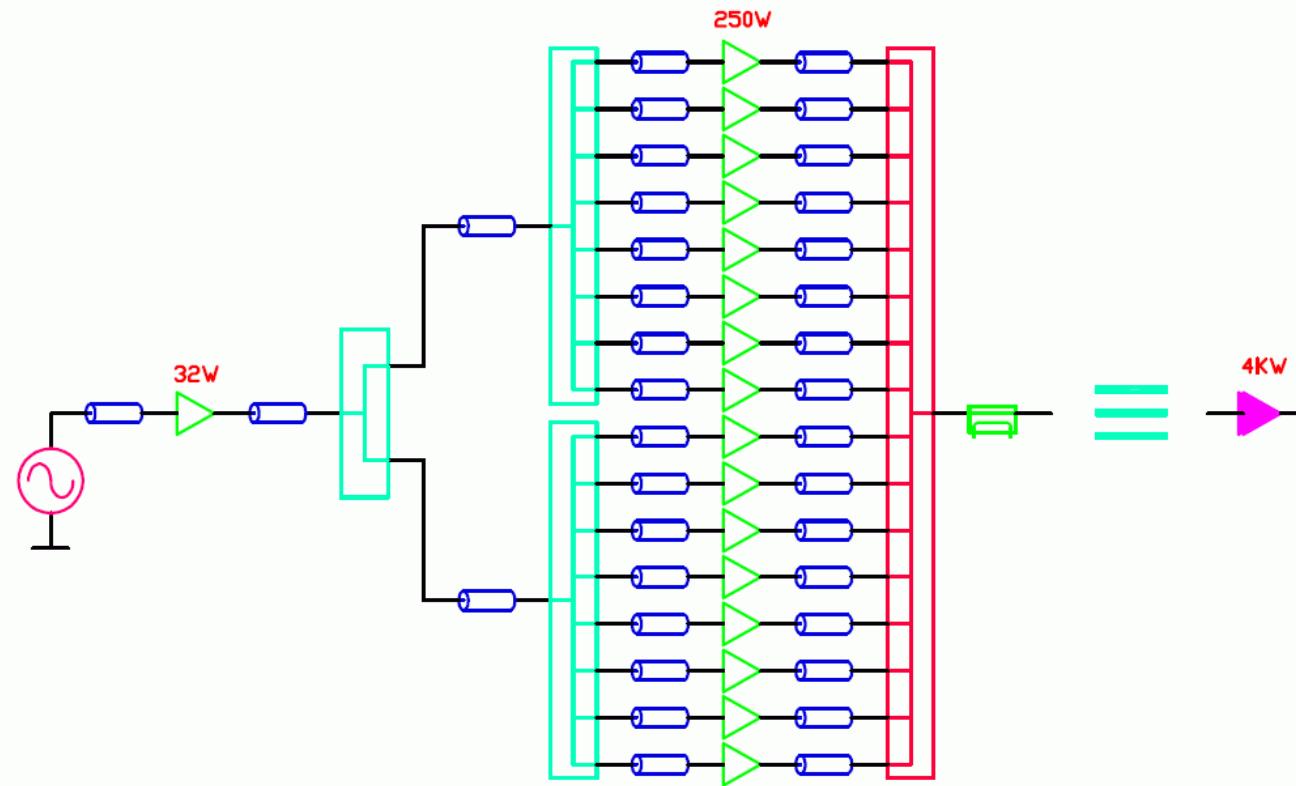

High Power Coupler: 1 Piece Available and Calibrated. Tested OK @ Pout=4KW (Industry)

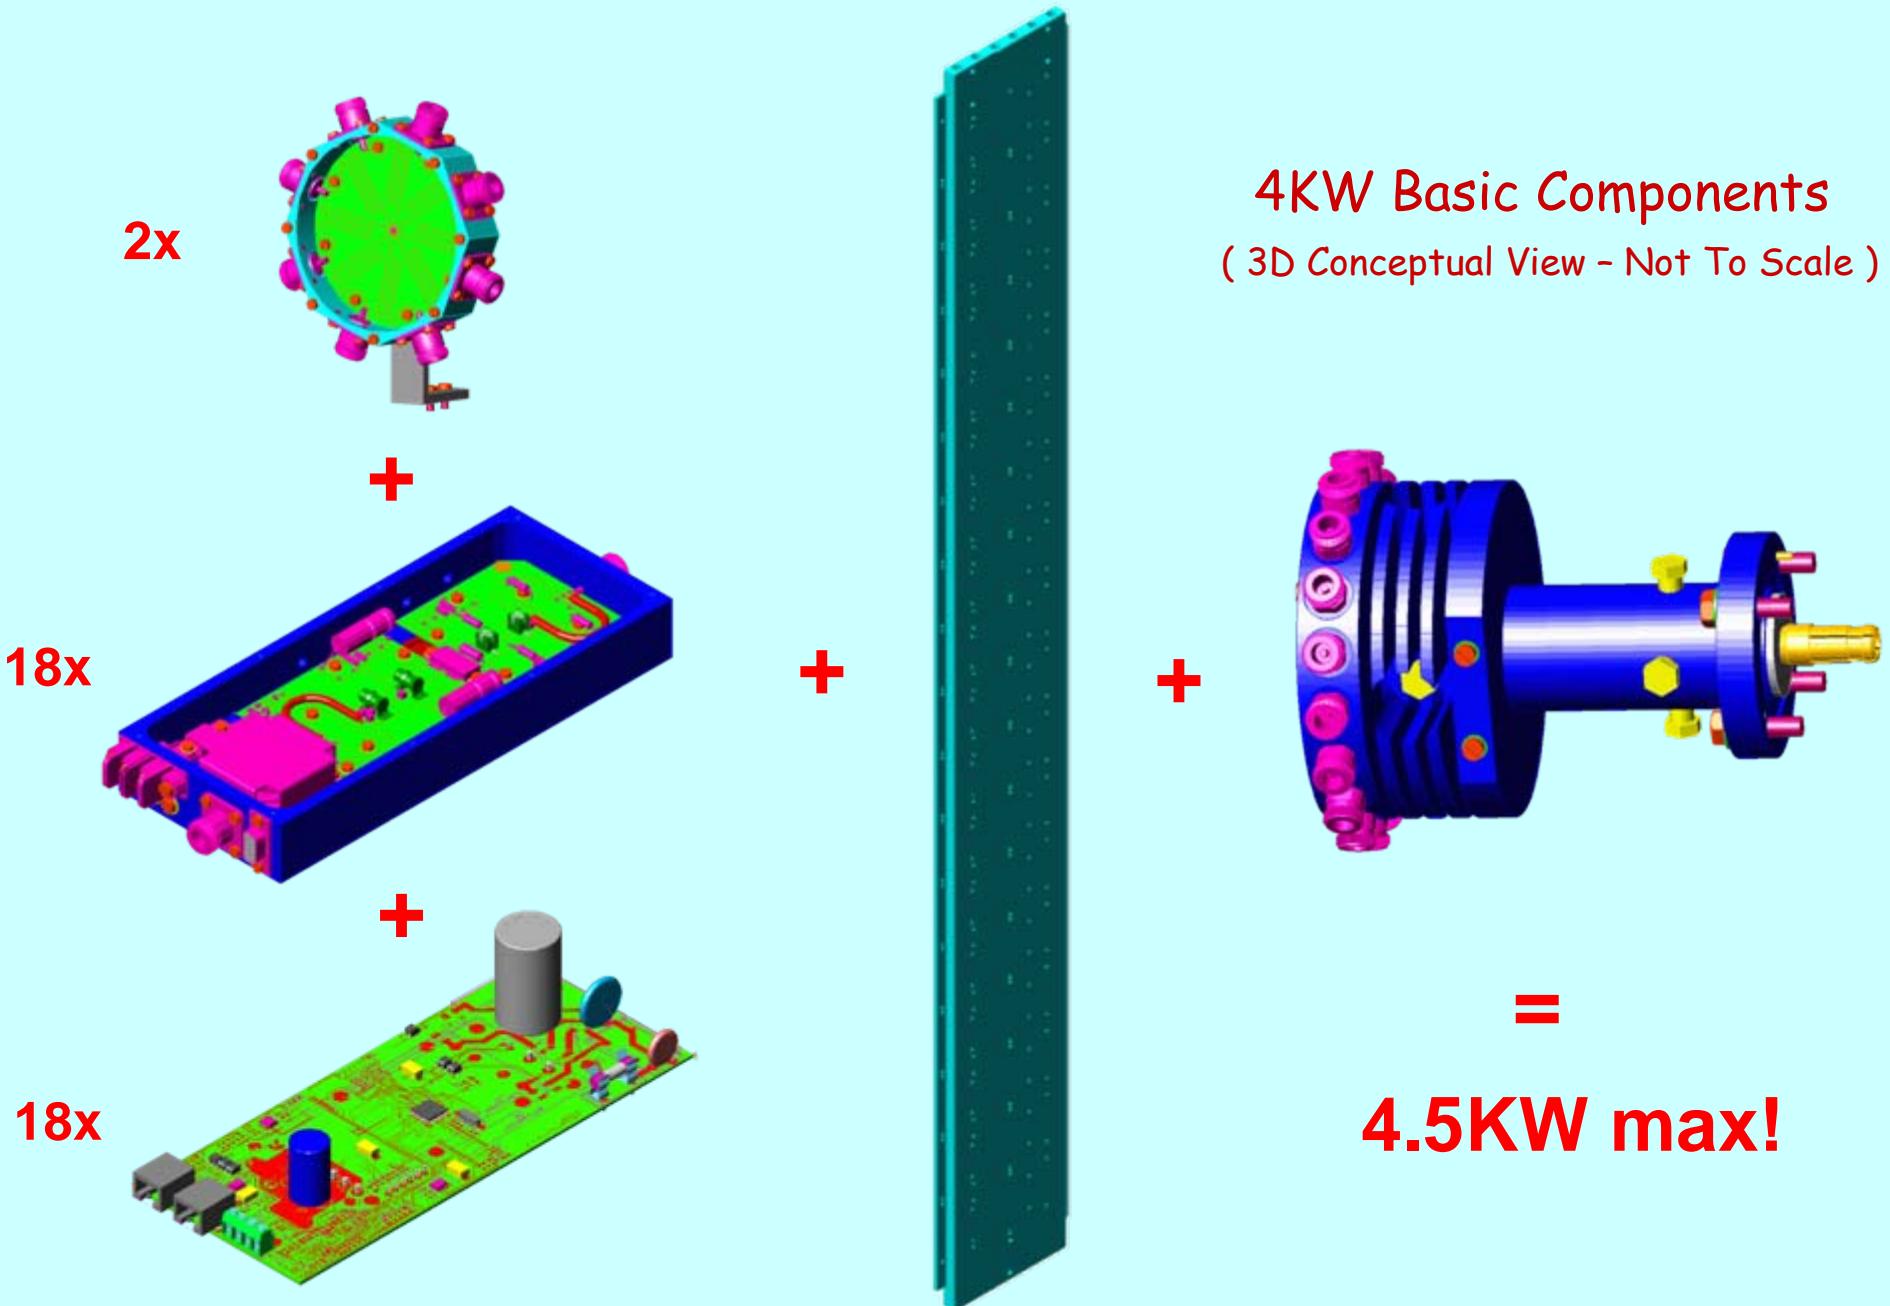

New Design in Progress (PSI Design)

Output Power Combiner: 2 18-Way Combiners Ready (Finished and Tested) (PSI Design)

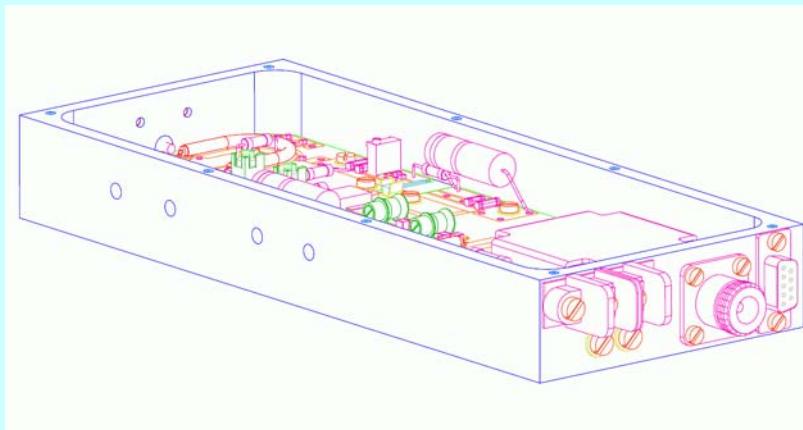

Also Successfully Tested under Maximum Output Power

4KW Amplifier Configuration

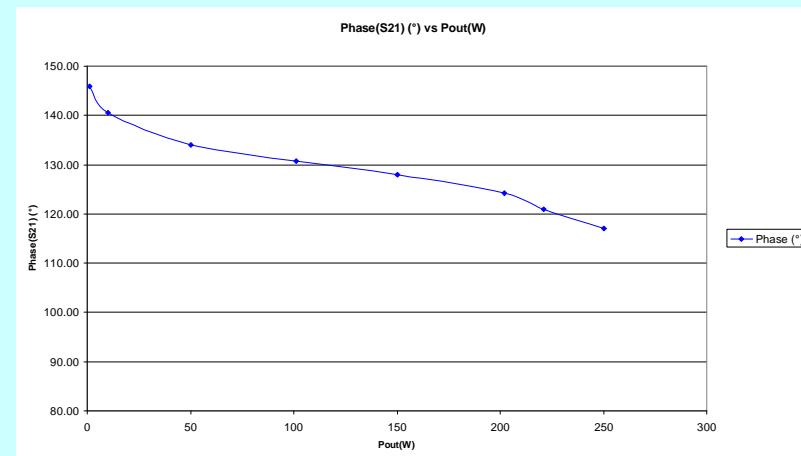

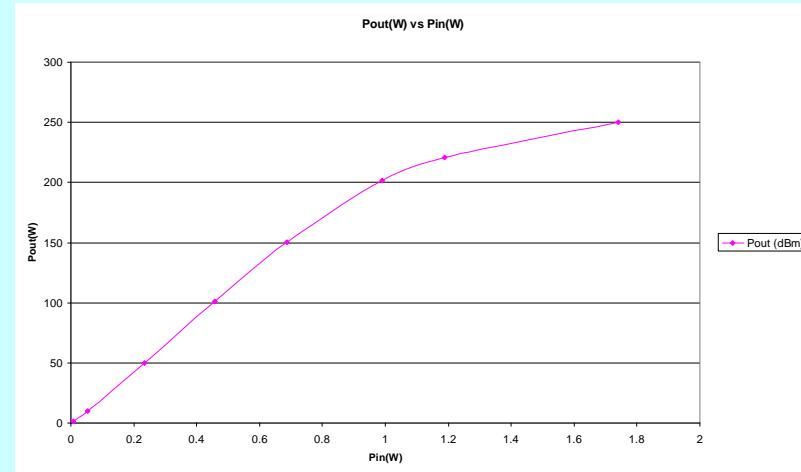

250W Amplifier Module

3D-View of 500MHz Amplifier Module

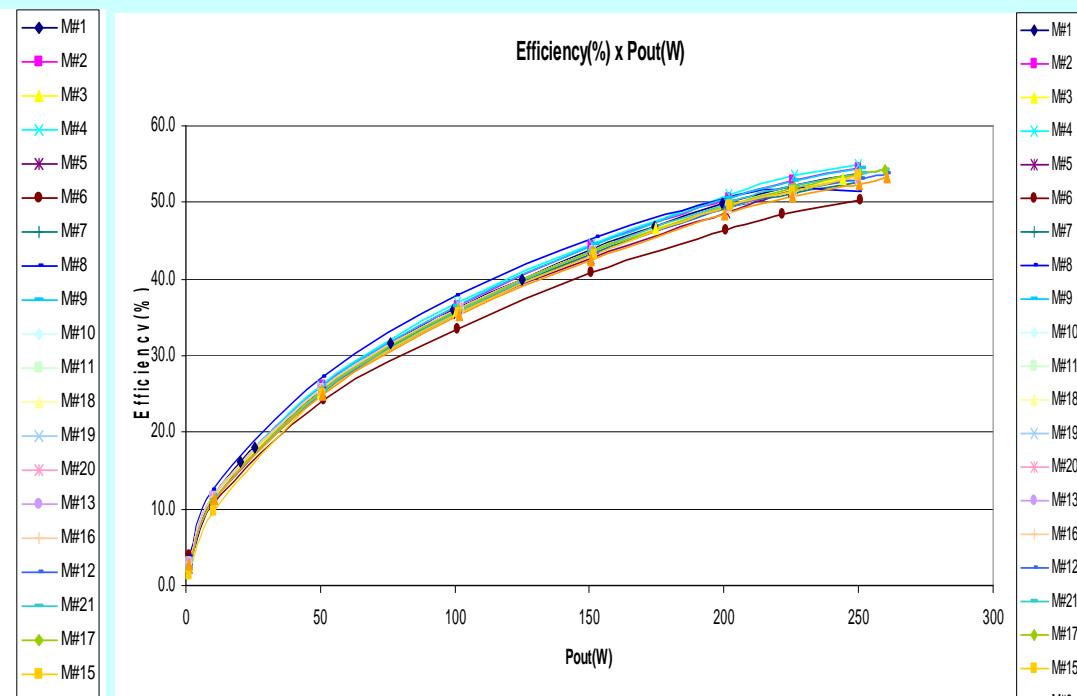

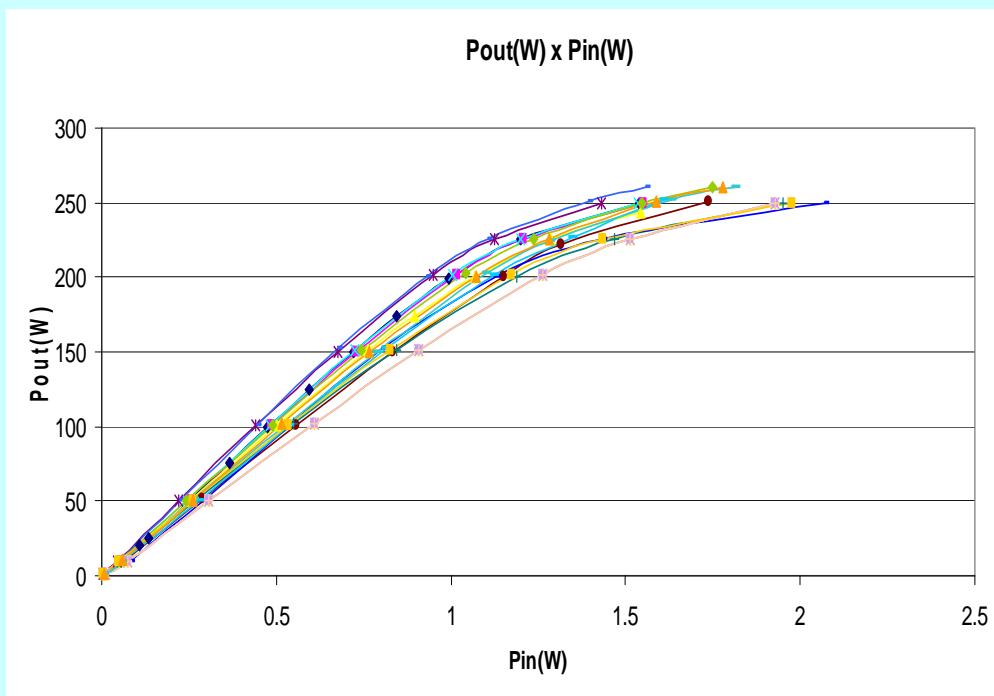

Key Performance Parameters

	Operation	Max
Output Power (with Circulator)	250W	280W
Gain	22dB	20dB
Efficiency	~ 54%	~ 50%

Efficiency versus Output Power

250W Amplifier Module

Performance of all available RF Modules

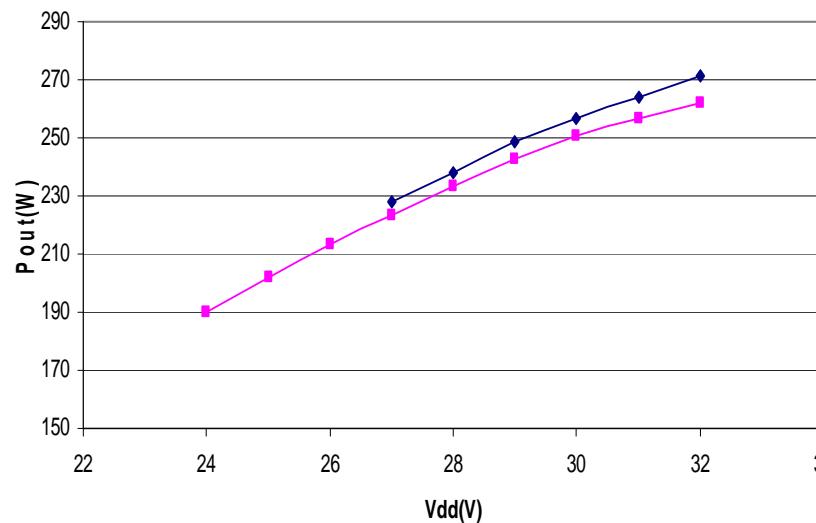

Gain versus Output Power

Phase Delay versus Output Power

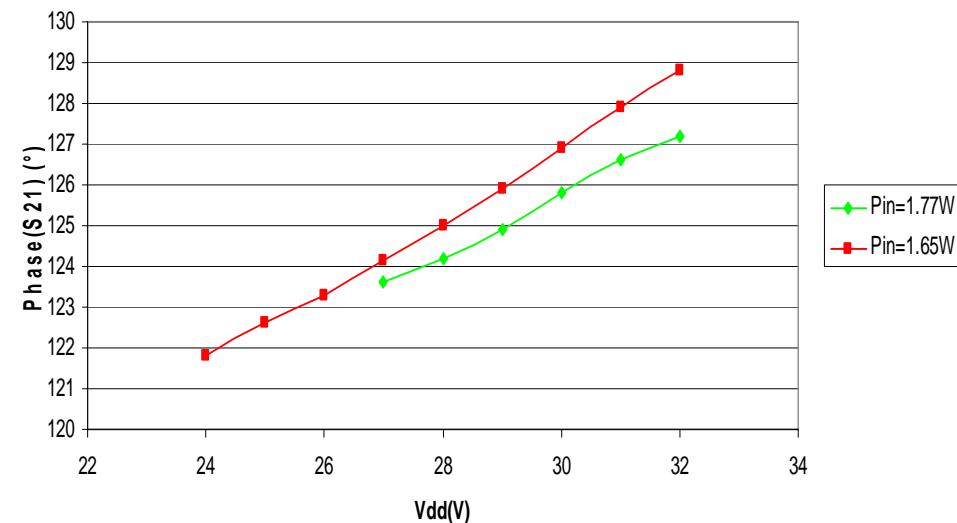

250W Amplifier Module

Forced Compression as a Useful Method

Pout(W) x Vdd(V)

Phase(S21) (°) x Vdd(V)

Output Power Variation due to Forced Compression

Phase Delay Variation due to Forced Compression

1. Since our Power Supply Controllers allow the Power Supply Voltage (Vdd) to be changed remotely we use Forced Compression to equalize the output powers of all amplifiers and then maximize the Combining Efficiency.
2. Notice that the Phase Delay is not very much influenced by variations in Power Supply Voltage. So Forced Compression is a viable method.

250W Amplifier Module

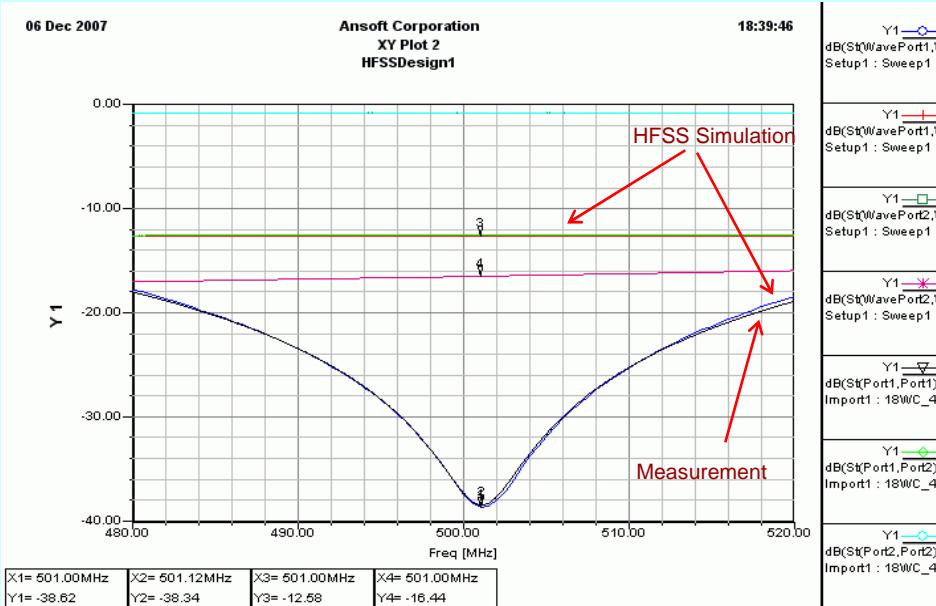

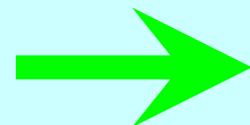

- Total 22 Modules Produced Now (18 for Amplifier, 4 Spares).
- All Modules Fully Assembled and Tested.
- Performance Agrees With Previous Results from Prototype.
- Remote Monitoring Working all right.

PSI development

18 Way Combiner - 500MHz

Key Performance Parameters

BW > 10MHz ($S_{11} < -30\text{dB}$)

Precision Required for 18 Ways Realized with no Extra Costs

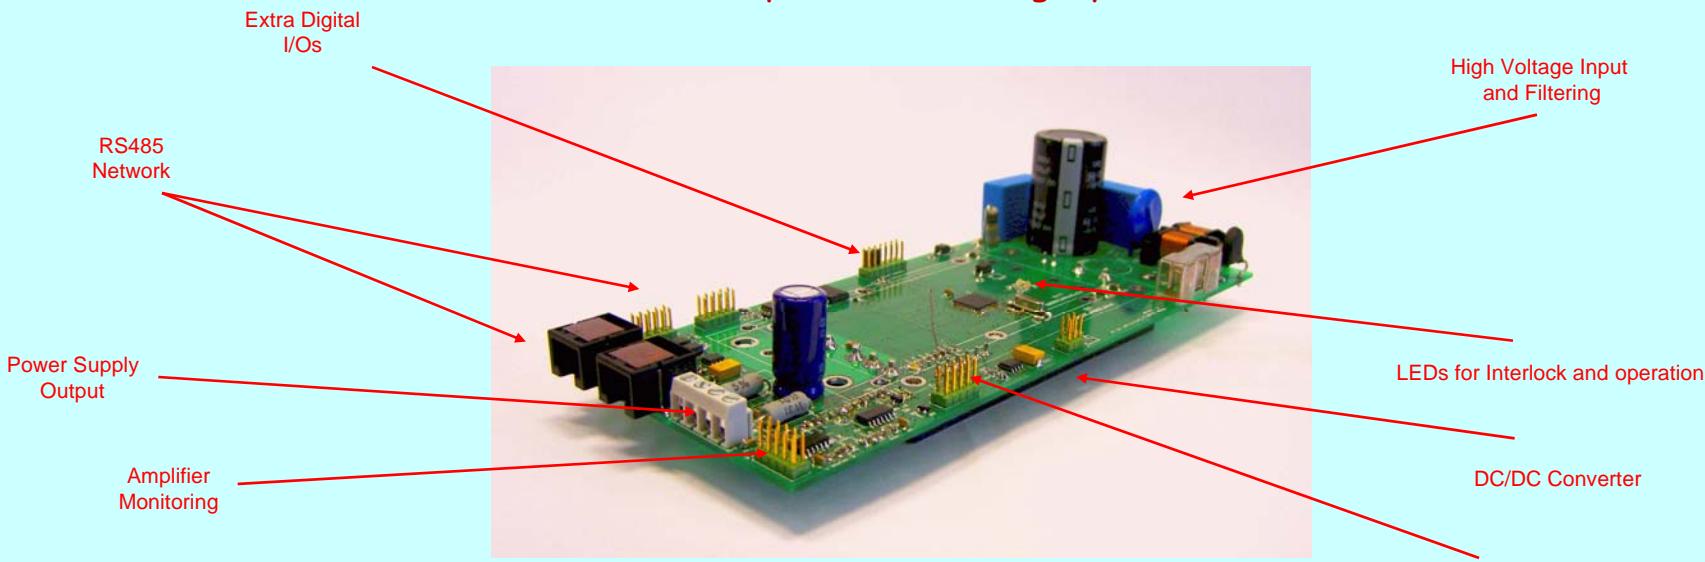

Efficiency > 99.6% (Overall Loss < 20W @ $\text{Pout}=4.5\text{KW}$)

High Power Temperature Measurement Results

Inner Conductor Temperature @ $\text{Pout}=4\text{KW} = 65^\circ\text{C}$ (estimated)

Outer Conductor Temperature @ $\text{Pout}=4\text{KW} = 43^\circ\text{C}$

Power Supply Controller (and Complete Monitoring System)

Main Features

Output Power: 600W
Output Voltage Range: 16.7V to 33.5V
Input Voltage Range: 200V to 400V
Efficiency: ~ 90%
Can be Remotely Programmed and Monitored
Extra Analog and Digital I/Os
Multi-tasking Script Operating System (SOS)
Interlock Reaction Time: ~ 1uS
Full Monitoring Loop Time: ~ 150mS

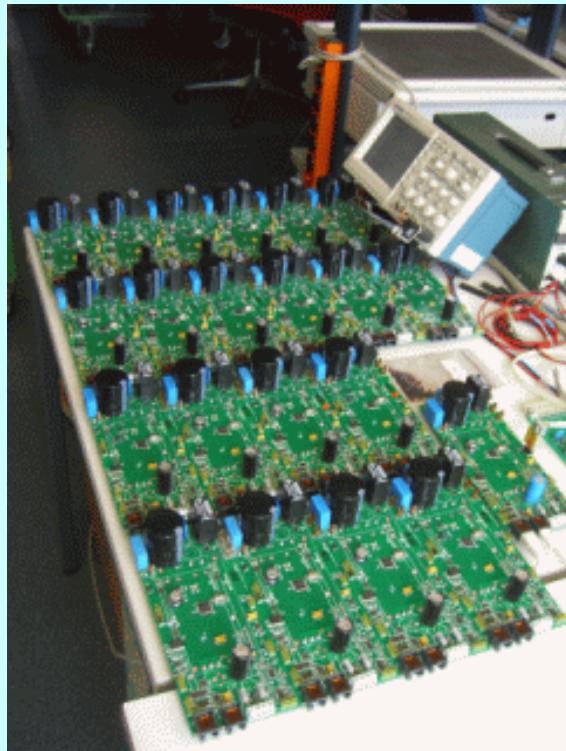

Design Finished

25 Pieces Available Now

19 Pieces – No Failures in Long Duration Tests

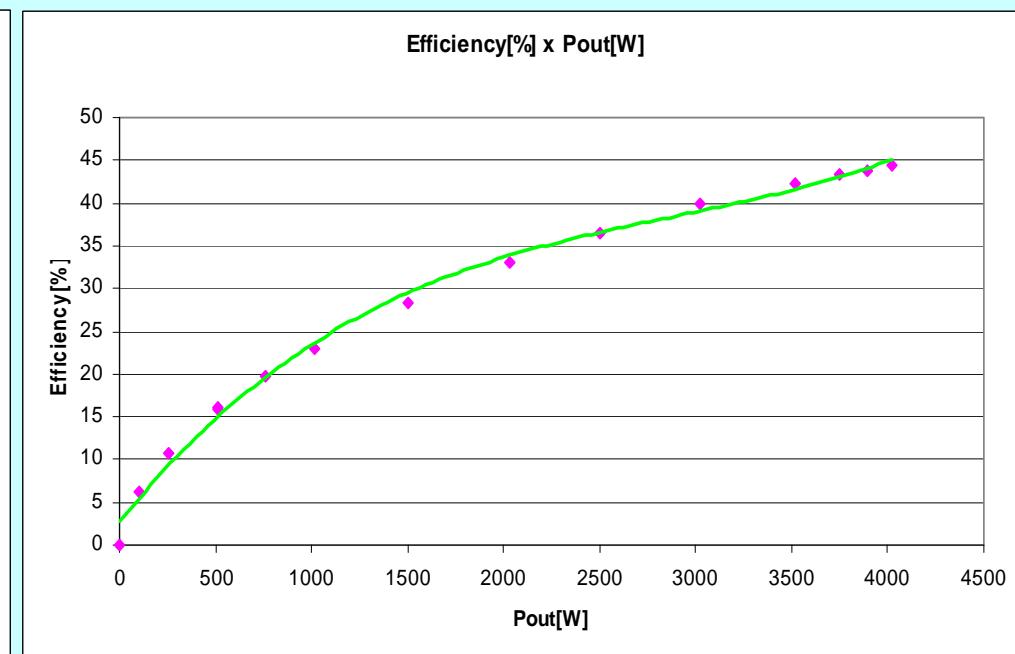

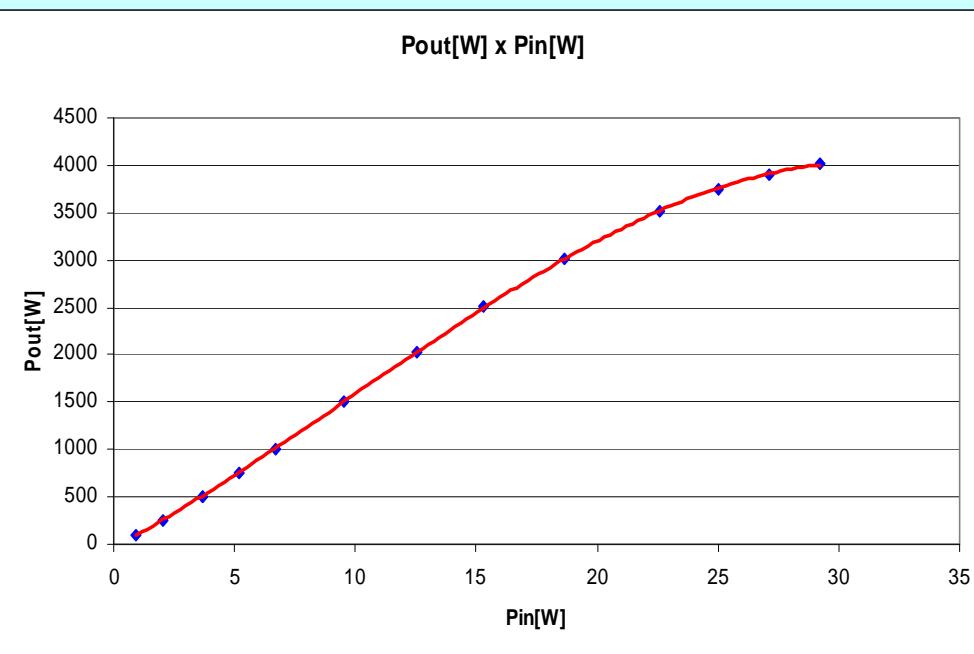

Power Supply Controller

- Total 25 Boards Produced (18 for Amplifier, 7 Spares).
- Operating System Installed.
- All Tests Completed (Power and Monitoring).
- 19 Boards Passed Initial Long Duration Tests without Failures.

Main Features

Client-Server Design

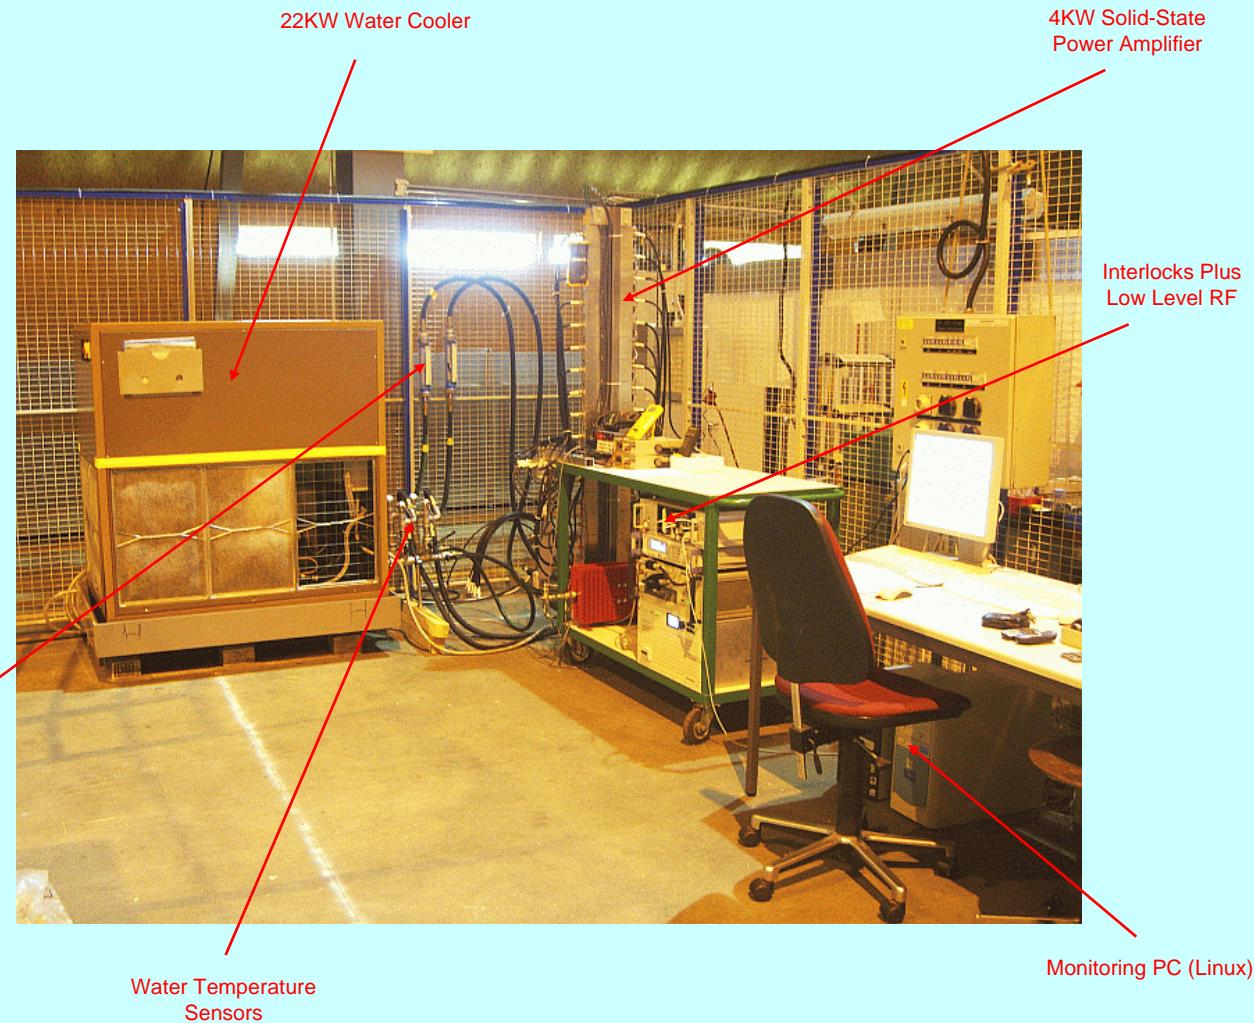

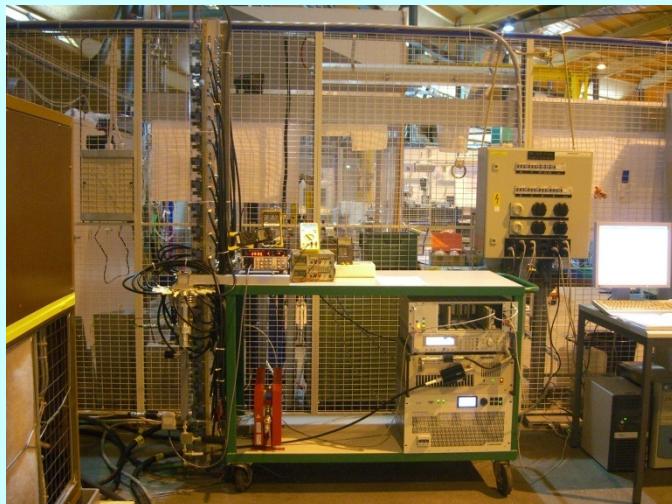

Graphical User Interface provided by Web-Browser

Data Interpolation, Translation and Interlock Checks Easily Configurable.

Hardware and Software Devices Allowed.

Easily Expandable for Larger Installation.

4KW Solid-State Power Amplifier Teststand in SLS

Conclusions

- 18 RF Modules Successfully Combined and Tested Under High Power.
- Very Stable Operation. About more than a Month of Operation and Tests.
- All Produced Modules showed very Similar Performance as the First Prototype RF Module.
- Forced Compression Proven to be Easy and Useful Method to Improve Amplitude Equalization of all RF Modules and to Optimize Overall Efficiency. At $P_{out}=4\text{KW}$ the Output Power of all Modules could be Equalized to about +/-5% around the Average value.
- Power Supply Controller Heavily Tested. Monitoring and Data Acquisition Concept Proven.
- 18-Way Power Combiner Successfully Tested under High RF Power.
- Long Duration Tests in Preparation.
- Complete Amplifier proven to be Very Compact and Light.
